

Locked forecasting and uncertainty diagnostics

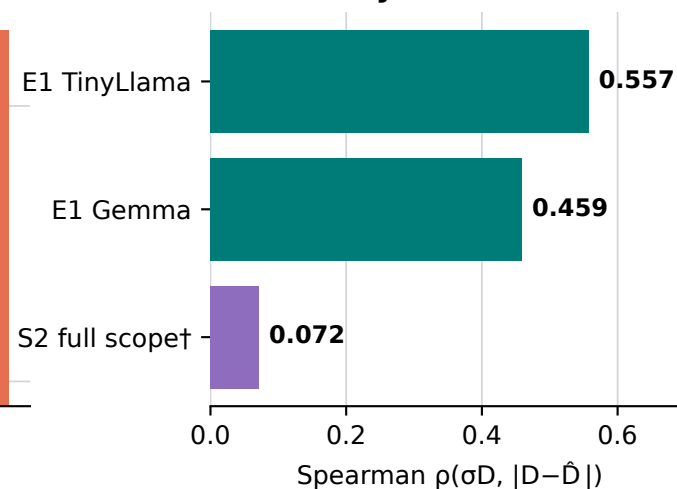

Forecast fit (locked E1 test)

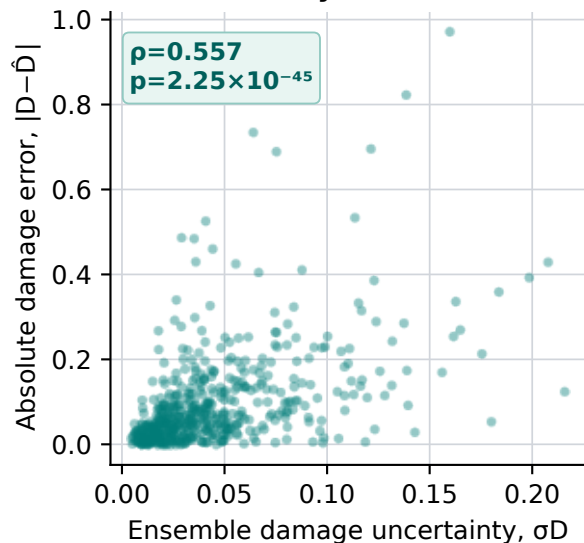

Forecast error (locked E1 test)

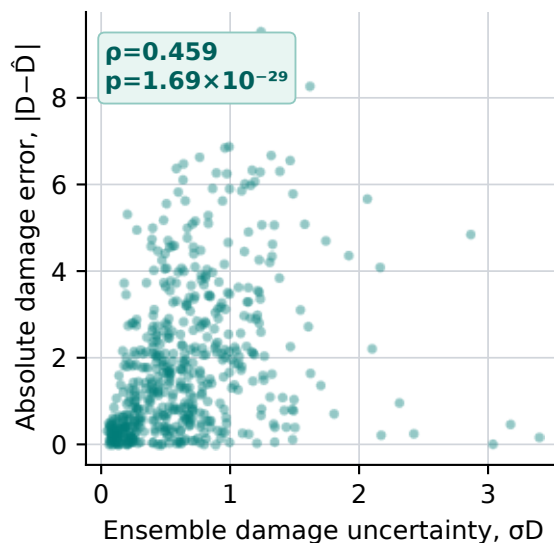

Uncertainty-error association

TinyLlama

Gemma

Interpretation scope

1. Gain has markedly higher R^2 than damage in both locked E1 tests.
2. External ensemble uncertainty ranks damage error positively, but S2 full-scope transport is weak ($\rho \approx 0.072$).

These are diagnostic findings, not a universal calibration or forecasting claim.
